

The Intelligent Dialogue Robot

Based on *ai-one*[™] technology from semantic system ag

semantic system ag is appointed by **intueri ag**, to build a trainer – similar to a flight simulator. The dialogue robot can be setup for different sectors, focused on various cases and will act in different roles. The trainer robot initiates the dialogue and the trainee has to respond and solve the problem! **intueri ag** already has various customer requests for the coming application.

Matthias Meyer, CEO of intueri ag explains: For the first time, a robot has a motivation driver and can be instructed with a case in which a problem needs to be solved. The conversation will take as long as the trainee gives the expected instructions or right answers.

The project is very ambitious, says **Walter Diggelmann**, CEO of semantic system ag: We are vendors who deliver the core intelligence for the system. We call it: **[BII]** “*Biologically Inspired Intelligence*” We have made alpha studies to find out, whether artificial intelligence already has reached the stage to take on such tasks. And – yes, we have seen that we can fulfill the requirements.
